advertisement

From early on in pregnancy, babies grow at different rates, so these numbers are merely averages. Your baby's actual length and weight may vary substantially. Don't worry too much if an ultrasound indicates that your baby is much smaller or larger. (Your practitioner will let you know if it's time to worry about how big your baby is.) By full-term, your baby may end up weighing less than 5 pounds or more than 9.

Note that babies are measured from the crown (or top) of the head to the rump (or bottom) until about 20 weeks. After that, they're measured from head to toe. (This is because a baby's legs are curled up against his torso during the first half of pregnancy and very hard to measure.) See our help section if you have questions about how we count the weeks of pregnancy and gestational age.

Member Comments

I just had a 28 week ultrasound and the baby is 4 lbs 6 oz. Is this normal? I mean he seems huge compared to the chart.

That might not have been an ultrasound measurement. If they were measuring your fundal height, 26 cms is nothing to worry about. I usually measure 2 weeks behind and have decent sized babies :)
